

Centrifuge Modular Package with Telescopic Skid

Decanter centrifuge is a kind of equipment used very often in oil drilling separation process. Like in the drilling mud recycling system, the decanter centrifuge is located after the de-silter cyclone unit for ultra fine solids separation. Some operators will install the decanter centrifuge unit on the mud tank top, while, the decanter centrifuge is not used all the time during the drilling. Thus, some drillers take out the decanter centrifuge from the mud tank system and put it on a skid closed to the mud tank system for easy connection once needed.

Comparing with other solids control equipment in the mud recycling system, the decanter centrifuge is of high cost. This is also one reason it will be taken out from the mud tanks system, always, the driller will find a third party who owns the centrifuge unit to sign the lease agreement.
